## 3 steps to start using CDN acceleration service

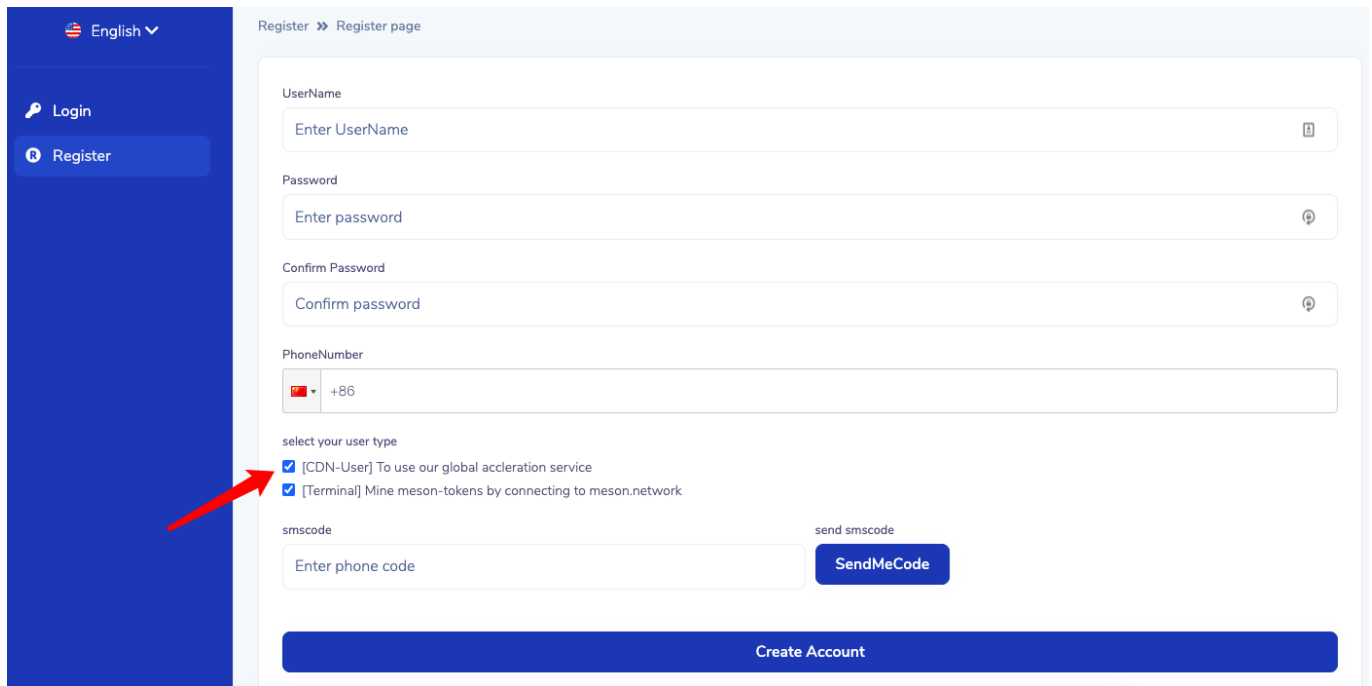

Step1. Register an account and log in

Enter official website <https://meson.network>

Register as a cdn user

Check the cdn user

The screenshot shows a web interface for user registration. On the left is a dark blue sidebar with a language selector (English) and buttons for Login and Register. The Register button is highlighted with a red arrow. The main content area is titled 'Register >> Register page' and contains several input fields: UserName (with a hint 'Enter UserName'), Password (with a hint 'Enter password'), Confirm Password (with a hint 'Confirm password'), and PhoneNumber (with a country code dropdown set to +86). Below these fields are two checked checkboxes under 'select your user type': '[CDN-User] To use our global acceleration service' and '[Terminal] Mine meson-tokens by connecting to meson.network'. There is also an 'smscode' field with a 'send smscode' button labeled 'SendMeCode'. At the bottom of the form is a large blue button labeled 'Create Account'.

## Step2. Create resource acceleration link

Enter the `Client` => `BindDomain` page,

Create resource acceleration link

#####Tutorial on how to accelerate your file #####

for example you want a file to be accelerated :

`https://yourdomain.com/static/testfiles/t1.jpg`

1.you can input yourdomain.com into [add your location] then click [Check input url]

2.if no error then click [Add Record]

after step 2 you will have a new record [in bottom table] with a cdn url like 'coldcdn.com/api/cdn/r7JEqR'

3.now you can simply replace the old url and get a new url:

`https://coldcdn.com/api/cdn/r7JEqR/static/testfiles/t1.jpg`

now request this new url and meson needs some time to deploy the file on distributed terminals globally

anyone can request the new url which is accelerated by meson.net globally

---

add your location

`www.mydomain/static/img`

For http acceleration in your own application replace your location url to :

`http://coldcdn.com/api/cdn/*****qm`

For https acceleration in your own application replace your location url to

`https://coldcdn.com/api/cdn/*****qm`

**Check Input Url**

Note

simply replace your url with our url in your application,all your files will be accelerated e.g : `https://www.mydomain/static/img/*` will become `https://coldcdn.com/api/cdn/*****qm/*`

Fill in the link of your website's static resources in the red box.

For example, if you want to accelerate all the image resources in your website, which are stored in the root directory of `website/static/img` directory, you can fill in here. e.g. `www.yourdomain.com/static/img`

Click **Check Input Url**

If the verification is correct, the button will turn green, click **Add Record**

add your location

`www.mydomain/static/img`

For http acceleration in your own application replace your location url to :

`http://coldcdn.com/api/cdn/*****qm`

For https acceleration in your own application replace your location url to

`https://coldcdn.com/api/cdn/*****qm`

**Add Record**

Note

simply replace your url with our url in your application,all your files will be accelerated e.g : `https://www.mydomain/static/img/*` will become `https://coldcdn.com/api/cdn/*****qm/*`

The acceleration link you created will be displayed below

id	state	active region	user url	cdn url	Action	settings
50	ON	Asia Africa South America Oceania North America Europe Other	www.mydomain/static/img	coldcdn.com/api/cdn/...qm	Refresh Delete	settings

Step3. Replace the original static resource link in the webpage with an accelerated link

Replace resource link

```
<!DOCTYPE html>
<html lang="en">
<head>
  <meta charset="UTF-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <title>Document</title>
</head>
<body>
  
  
</body>
</html>
```

Replace the resource link you need to accelerate with the link you generated in the previous step, as shown in the figure above, replace the content in the red box with the new link.

If your webpage supports https, please use https://, if not, please use http://

---

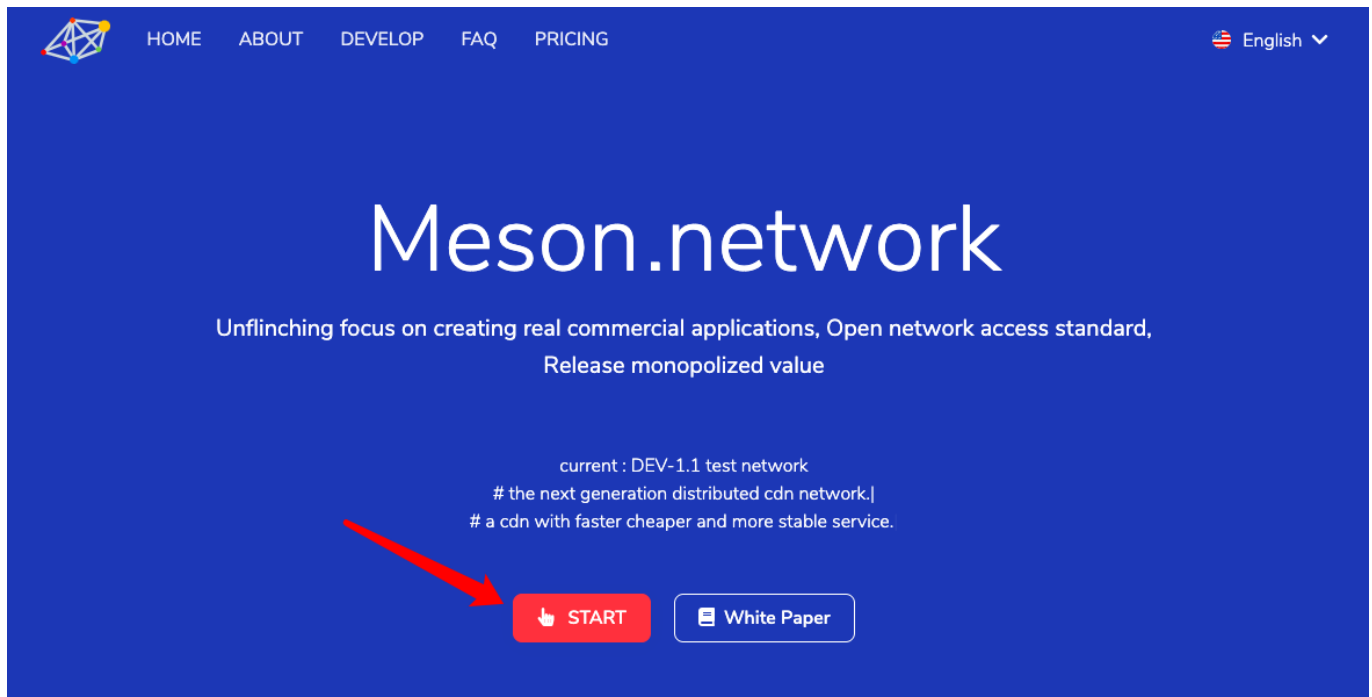

## Miner mining guide

You only need a server with a public IP to become a miner and earn your income

Step1. Register an account and log in

Enter official website <https://meson.network>

Register as a `terminal` user

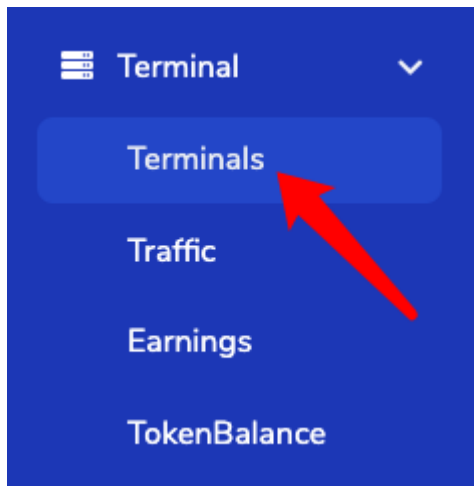

Check **terminal** user

The image shows the registration page of Meson.network. The page has a blue sidebar on the left with "Login" and "Register" options. The main content area is titled "Register >> Register page". It contains several input fields: "UserName" (placeholder: Enter UserName), "Password" (placeholder: Enter password), "Confirm Password" (placeholder: Confirm password), and "PhoneNumber" (placeholder: +86). Below these fields, there is a section "select your user type" with two checkboxes: "[CDN-User] To use our global acceleration service" and "[Terminal] Mine meson-tokens by connecting to meson.network". A red arrow points to the "[Terminal]" checkbox. Below the checkboxes, there is a "smscode" field (placeholder: Enter phone code) and a "SendMeCode" button. At the bottom, there is a large blue button labeled "Create Account".

Step2. Download and run the Terminal client

Enter the **Terminal**=>**Terminals** page,

ssh to your server, select the client corresponding to your operating system, download, unzip and run

When running for the first time, the program will prompt you:

**token** -- User identifier, you can find from website

**spaceLimit** -- Hard disk space provided for service, at least 80G. The greater the storage space provided, the higher your profit will be

**port** -- External service port, please do not use port 80 or 443, and ensure that your firewall will not block this port

After the configuration, the terminal will run normally

Step3. Check the server status

Usually in a few minutes, you can see that your server is online and running at the bottom of the web page

My Token

ZhKXXXXXXXXXXXXv==

copy

ID	Mac Addr	IP	port	country	cdn_space_usa...	memory_usag...	version	status
80323	00:16:3e:01:06:...	8.134.11.108	19091	China	0.39%	38.85%	0.1.3	ON
80325	06:9b:60:b3:c3:...	15.151.10.100	19091	United States	1.68%	67.56%	0.1.2	DOWN

If the server's **Status** is **ON**, it means your server has been running normally and has been included in our accelerated network

Step4. Keep terminal running in the background

Let the Terminal program run in the background, and recommend to set up a boot-up

Note: In the meson network, the same IP is regarded as the same machine, so please do not run multiple Terminal programs on the same IP and the same server. This will not increase your income, and may be regarded as Cheating
